GutFeeling

A simple diary for food and digestive symptoms

Helps people notice possible patterns over time.

Project idea / 3–5 minute pitch

Why a food diary can help

Meals are easy to forget.

Symptoms may begin hours later.

Stress and daily routines can also affect how someone feels.

GutFeeling keeps these notes together across days.

A diary in three quick steps

1. **Meal**
   Choose a saved recipe or add food and time.
2. **Symptoms**
   Record what you feel and when it starts.
3. **Daily context**
   Add stress, stool notes, or cycle details if useful.

Recipes can be imported from a web link, then checked and edited.

The app looks for repeated patterns

It compares meals, ingredients and symptom timing across days.

It includes context such as stress and optional cycle

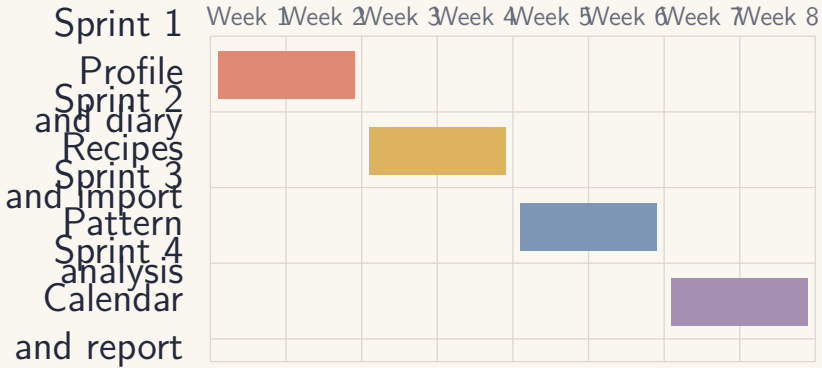

What the user gets

Possible food links to review

A view of other factors

An eight-week project plan

Four two-week sprints, managed in Linear and Tiny Scrum.

Each sprint ends with a review and retrospective.
